

# ELF

## Electronic Lens Finder

The ELF – Electronic Lens Finder detects covert camera lenses. It's built upon a foundation of rigorous research and technical precision, ensuring its relevance in professional applications.

The ELF system makes use of optical illuminators, which, when engaged, generate a reverse reflection from hidden camera lenses. This reflection, visible as either green or red dots, can be clearly observed through the ELF's dedicated optical binoculars, aiding in the accurate identification and location of concealed cameras.

### ELF Delivery Set Includes:
